Summary

Summary of yesterday

- Yesterday we discussed some formal aspects of supersymmetric scattering.
- We described an onshell superspace formalism and showed how supersymmetric ward identities relate various $2 \rightarrow 2$ processes in the theory.
- We saw that higher supersymmetries put much more constraints on the number of independent processes.
- In the course of the talks we discussed $2+1$ d bosonization duality
$$U(N) \text{ CS} + \text{fundamental boson at Wilson Fisher limit} \\ \Leftarrow \text{dual} \Rightarrow \\ U(N) \text{ CS} + \text{fundamental fermion}$$
- We also discussed the conjectured selfduality in Supersymmetric Chern-Simons matter theories.

Summary

Scattering in CS matter theories

- The statement of **duality** is actually a statement of **bosonization of fermions**.
- Bosonic and fermionic S matrices related by **duality** is equivalent to a **bosonization map**.
- Such a mapping is **possible in 2+1 dimensions**: Dirac equation **uniquely** determines the **polarization spinors** as a function of the **momentum**.
- In **large N** limit, only **planar diagrams** contribute. Possible to get **exact results** as a function of 't Hooft coupling λ .
- It has been shown that the **S matrices** for $2 \rightarrow 2$ processes in the **CS+bosonic** theory map to the **CS+fermionic theory** under **duality**.

[Jain, Mandlik, Minwalla, Takimi, Wadia, Yokoyama]

Channels of scattering

- Particle-Particle scattering: $p_1 + p_2 \rightarrow p_3 + p_4$

$$\text{Fundamental} \otimes \text{Fundamental} \rightarrow \text{Symmetric}(U_d) \oplus \text{Anti-symmetric}(U_e)$$

- Particle-Antiparticle scattering

$$\text{Fundamental} \otimes \text{Antifundamental} \rightarrow \text{Adjoint}(T) \oplus \text{Singlet}(S)$$

Scattering in CS matter theories: Peculiarities

Chern-Simons matter theories - 3
2 \rightarrow 2 scattering in supersymmetric matter Chern-Simons theories at large N

- Scattering results **consistent with duality**.
- In **singlet channel** (particle-Antiparticle) S matrices obtained from **naive crossing symmetry** rules are **inconsistent with unitarity** and have **incorrect non-relativistic limit**.
- **Consistency with unitarity** requires
 - **Delta function** term at forward scattering.
 - **Modified crossing symmetry** rules.
- **Conjecture**: Singlet channel S matrices have the form

$$\mathcal{S} = 8\pi\sqrt{s}\cos(\pi\lambda)\delta(\theta) + i\frac{\sin(\pi\lambda)}{\pi\lambda}\mathcal{T}^{S;\text{naive}}(s, \theta)$$

- $\mathcal{T}^{S;\text{naive}}$ is the matrix obtained from **naive analytic continuation** of **particle-particle** scattering.

Summary

Nature of the conjecture: Delta function and modified crossing rules

Chern-Simons matter theories - 3
2 \rightarrow 2 scattering in supersymmetric matter Chern-Simons theories at large N

$$\mathcal{S} = 8\pi\sqrt{s}\cos(\pi\lambda)\delta(\theta) + i\frac{\sin(\pi\lambda)}{\pi\lambda}\mathcal{T}^{\mathcal{S};\text{naive}}(s, \theta)$$

- The conjectured S matrix has a **non-analytic $\delta(\theta)$ piece**.
- **delta function** is already known to be **necessary to unitarize** non-relativistic **Aharonov-Bohm scattering** [Ruijsenaars; Bak, Jackiw, Pi] (first talk).
- **$\cos(\pi\lambda)$** is due to the **interference of the Aharonov-Bohm phases** of the wave packets.
- modified crossing factor $\frac{\sin(\pi\lambda)}{\pi\lambda}$ is the **expectation value of circular wilson loop** on S^3 in **pure Chern-Simons theory** [Witten].

Introduction

Summary of yesterday

Scattering in CS matter theories

Delta function and modified crossing

Our work

Exact computation of all orders S matrix

Unitarity

Pole structure

Summary

Modified crossing - A heuristic explanation

- attach Wilson lines to make correlator gauge invariant.

$$T_{U_d} W_{U_d} \rightarrow T_S W_S$$

$$\frac{W_{U_d}}{W_S} = \frac{\oint \text{with 2 circular Wilson lines}}{\oint \text{with 1 circular Wilson line}} = \frac{\sin(\pi\lambda)}{\pi\lambda} \quad [\text{Witten}]$$

Unitarity and anyonic behavior in Singlet Channel

- Unitarity $i(T^\dagger - T) = TT^\dagger$: non-trivial only for singlet channel in the large N limit .

$$T_{Asym} \sim T_{Sym} \sim T_{Adj} \sim O\left(\frac{1}{N}\right), \quad T_{sing} \sim O(1)$$

- One loop cut structure (generalizes to all loops)

- Singlet channel is effectively anyonic - usual crossing rules fail unitarity. Anyonic phase operator $\nu_m = \frac{C_2(R_1) + C_2(R_2) - C_2(R_m)}{2\kappa}$,

$$\nu_{Asym} \sim \nu_{Sym} \sim \nu_{Adj} \sim O\left(\frac{1}{N}\right), \quad \nu_{Sing} \sim O(\lambda)$$

- Remedy: delta function and modified crossing rules.

Universality and tests

- delta function and modified crossing rules - appear to be universal
- Tests:
 - Unitarity of the S matrix
 - Bose-Fermi duality
 - Non-relativistic limit gives Aharanov-Bohm
- All the tests have been explicitly verified for
 - $U(N)$ Chern-Simons coupled to fundamental bosons
 - $U(N)$ Chern-Simons coupled to fundamental fermions
 - $\mathcal{N} = 1, 2$ Supersymmetric $U(N)$ Chern-Simons matter theories
- Further investigations ongoing for $\mathcal{N} = 3, 4, 5, 6$ susy CS matter theories [K.I, S.Jain, S.Minwalla, S.Yokoyama]

Scattering in CS matter theories

Delta function and modified crossing

Our work

Exact computation of all orders S matrix

Unitarity

Pole structure

Summary

Main results

- Results in perfect agreement with duality.
- Unitarity requires the delta function at forward scattering and crossing symmetry rules modified by exactly the same way as conjectured in
[Jain, Mandlik, Minwalla, Takimi, Wadia, Yokoyama]
- Substantial evidence for universality of the conjecture.

Summary

Theory

- General renormalizable $\mathcal{N} = 1$ theory coupled to single fundamental matter multiplet Φ

$$\begin{aligned} \mathcal{S}_{\mathcal{N}=1} = - \int d^3x d^2\theta \left[\frac{\kappa}{2\pi} \text{Tr} \left(-\frac{1}{4} D_\alpha \Gamma^\beta D_\beta \Gamma^\alpha \right. \right. \\ \left. \left. - \frac{1}{6} D^\alpha \Gamma^\beta \{ \Gamma_\alpha, \Gamma_\beta \} - \frac{1}{24} \{ \Gamma^\alpha, \Gamma^\beta \} \{ \Gamma_\alpha, \Gamma_\beta \} \right) \right. \\ \left. - \frac{1}{2} (D^\alpha \bar{\Phi} + i \bar{\Phi} \Gamma^\alpha) (D_\alpha \Phi - i \Gamma_\alpha \Phi) \right. \\ \left. + m_0 \bar{\Phi} \Phi + \frac{\pi w}{\kappa} (\bar{\Phi} \Phi)^2 \right] \end{aligned}$$

- Φ : complex superfield, Γ_α : real superfield

$$\begin{aligned} \Phi &= \phi + \theta \psi - \theta^2 F, \quad \bar{\Phi} = \bar{\phi} + \theta \bar{\psi} - \theta^2 \bar{F}, \\ \Gamma^\alpha &= \chi^\alpha - \theta^\alpha B + i \theta^\beta A_\beta^\alpha - \theta^2 (2\lambda^\alpha - i \partial^{\alpha\beta} \chi_\beta). \end{aligned}$$

- Integer parameters N, κ , matter coupling constant w , 't Hooft coupling $\lambda = \frac{N}{\kappa}$.

Supersymmetric light cone gauge

Chern-Simons matter theories - 3
2 \rightarrow 2 scattering in supersymmetric matter Chern-Simons theories at large N

- Supersymmetric generalisation of light cone gauge

$$\Gamma_- = 0 \Rightarrow A_- = A_1 + iA_2 = 0$$

- Gauge self interactions **vanish**

$$S = - \int d^3x d^2\theta \left[-\frac{\kappa}{8\pi} \text{Tr}(\Gamma^- i \partial_{--} \Gamma^-) - \frac{1}{2} D^\alpha \bar{\Phi} D_\alpha \Phi \right. \\ \left. - \frac{i}{2} \Gamma^- (\bar{\Phi} D_- \Phi - D_- \bar{\Phi} \Phi) \right. \\ \left. + m_0 \bar{\Phi} \Phi + \frac{\pi W}{\kappa} (\bar{\Phi} \Phi)^2 \right]$$

- Susy light cone gauge maintains **manifest supersymmetry**.

Summary

Bare Propagators

- The bare scalar superfield propagator:

$$\langle \bar{\Phi}(\theta_1, p) \Phi(\theta_2, -p') \rangle = \frac{D_{\theta_1, p}^2 - m_0}{p^2 + m_0^2} \delta^2(\theta_1 - \theta_2) (2\pi)^3 \delta^3(p - p')$$

- The gauge superfield propagator:

$$\langle \Gamma^-(\theta_1, p) \Gamma^-(\theta_2, -p') \rangle = -\frac{8\pi}{\kappa} \frac{\delta^2(\theta_1 - \theta_2)}{p_{--}} (2\pi)^3 \delta^3(p - p')$$

where $p_{--} = -(p_1 + ip_2) = -p_-$.

- Gauge field component propagators have same form as non-susy light cone gauge

$$\langle A_+(p) A_3(-p') \rangle = \frac{4\pi i}{\kappa} \frac{1}{p_-} (2\pi)^3 \delta^3(p - p')$$

Summary

Strategy for computing S matrix

- Use off-shell supersymmetry to constrain the structure of two point and four-point functions in superspace.
- Use these structures to set up a Dyson-Schwinger series for exact propagator and exact off-shell four point function.
- work only with diagrams that contribute to leading order in the large N limit.
- read off S matrices from off-shell four point function by taking on-shell limits.

Summary

Exact propagator in large N limit

- Integral equation for self-energy

$$\Sigma(p, \theta_1, \theta_2) =$$

The image shows two Feynman diagrams representing terms in the self-energy integral equation. The first diagram is a tadpole loop, consisting of two fermion lines (solid lines with arrows) that meet at a single vertex, forming a loop. The second diagram is a bubble loop, consisting of two fermion lines (solid lines with arrows) that meet at two vertices, forming a loop, with a wavy boson line (dashed line) connecting the two vertices.

$$\begin{aligned} \Sigma(p, \theta_1, \theta_2) = & 2\pi\lambda w \int \frac{d^3r}{(2\pi)^3} \delta^2(\theta_1 - \theta_2) P(r, \theta_1, \theta_2) \\ & - 2\pi\lambda \int \frac{d^3r}{(2\pi)^3} D_-^{\theta_2, -p} D_-^{\theta_1, p} \left(\frac{\delta^2(\theta_1 - \theta_2)}{(p-r)_{--}} P(r, \theta_1, \theta_2) \right) \\ & + 2\pi\lambda \int \frac{d^3r}{(2\pi)^3} \frac{\delta^2(\theta_1 - \theta_2)}{(p-r)_{--}} D_-^{\theta_1, r} D_-^{\theta_2, -r} P(r, \theta_1, \theta_2) \end{aligned}$$

Exact propagator in large N limit

- Solution to **exact propagator** is extremely simple

$$P(p, \theta_1, \theta_2) = \frac{D^2 - m}{p^2 + m^2} \delta^2(\theta_1 - \theta_2)$$

- Same structure as the **bare propagator** with m_0 replaced by m
- m is the **pole mass**

$$m = \frac{2m_0}{2 + (-1 + w)\lambda \operatorname{Sgn}(m)}$$

is **duality invariant**, agrees with the pole mass computed by Jain, Minwalla, Yokoyama

- **Bonus:** In the $\mathcal{N} = 2$ limit ($w = 1$), **no mass renormalization** for $\mathcal{N} = 2$ theory !

An integral equation for the four point function

Figure: The diagrams in the first line pictorially represents the Schwinger-Dyson equation for offshell four point function. The second line represents the tree level contributions from the gauge superfield interaction and the quartic interactions.

An integral equation for the four point function

Chern-Simons matter theories - 3
2 \rightarrow 2 scattering in supersymmetric matter Chern-Simons theories at large N

- Schematically the integral equations are of the form

$$V(\theta_i, p_i) = V_0(\theta_i, p_i) + \int \frac{d^3 r}{(2\pi)^3} d^2 \theta'_j V_0(\theta_i, \theta'_j, p_i, r) P(\theta'_j, p_i + r) P(\theta'_j, r) V(\theta'_j, \theta_i, p_i)$$

- solved integral equations **exactly** in large N limit for **arbitrary** values of the **t'Hooft coupling** λ and determined the **offshell four point function** in the kinematic regime $q_{\pm} = 0$.
- Onshell limit** directly gives the S matrix for **T (adjoint), U_d (symm) and U_e (Asymm) channels of scattering** (q_{μ} is momentum transfer).
- Impossible to extract **S (singlet)** channel S matrix since **q_{μ} is center of mass energy** (cannot be spacelike).

Summary

S matrix in T , U_d, U_e channels of scattering

$$N_1 = \left(\left(\frac{2|m| + iq}{2|m| - iq} \right)^{-\lambda} (w-1)(2m+iq) + (w-1)(2m-iq) \right) ,$$

$$N_2 = \left(\left(\frac{2|m| + iq}{2|m| - iq} \right)^{-\lambda} (q(w+3) + 2im(w-1)) + (q(w+3) - 2im(w-1)) \right) ,$$

$$M_1 = -8mq((w+3)(w-1) - 4w) \left(\frac{2|m| + iq}{2|m| - iq} \right)^{-\lambda} ,$$

$$M_2 = -8mq(1+w)^2 \left(\frac{2|m| + iq}{2|m| - iq} \right)^{-\lambda} ,$$

$$D_1 = \left(i \left(\frac{2|m| + iq}{2|m| - iq} \right)^{-\lambda} (w-1)(2m+iq) - 2im(w-1) + q(w+3) \right) ,$$

$$D_2 = \left(\left(\frac{2|m| + iq}{2|m| - iq} \right)^{-\lambda} (-q(w+3) - 2im(w-1)) + (w-1)(q+2im) \right) .$$

Bonus: S matrix in T , U_d , U_e channels for $\mathcal{N} = 2$ theory

- Remarkable **simplification** in the $\mathcal{N} = 2$ limit ($w=1$)

$$\mathcal{T}_B^{\mathcal{N}=2} = \frac{4i\pi}{\kappa} \epsilon_{\mu\nu\rho} \frac{q^\mu (p-k)^\nu (p+k)^\rho}{(p-k)^2} - \frac{8\pi m}{\kappa},$$

$$\mathcal{T}_F^{\mathcal{N}=2} = \frac{4i\pi}{\kappa} \epsilon_{\mu\nu\rho} \frac{q^\mu (p-k)^\nu (p+k)^\rho}{(p-k)^2} + \frac{8\pi m}{\kappa}$$

- All orders S matrix is just tree level - **no loop corrections** - non renormalization.

Duality invariance of $\mathcal{N} = 1$ and $\mathcal{N} = 2$ S matrices

Chern-Simons matter theories - 3
2 \rightarrow 2 scattering in supersymmetric matter Chern-Simons theories at large N

- Under the duality transformation

$$w' = \frac{3-w}{w+1}, \lambda' = \lambda - \text{sgn}(\lambda), m' = -m, \kappa' = -\kappa$$

$$J_B(q, \kappa', \lambda', w', m') = -J_F(q, \kappa, \lambda, w, m) ,$$

$$J_F(q, \kappa', \lambda', w', m') = -J_B(q, \kappa, \lambda, w, m) .$$

- Duality maps the purely bosonic and purely fermionic S matrices into one another upto overall phase.
- Concrete evidence for duality.
- Supersymmetric ward identity guarantees the duality invariance of all other processes.

Introduction

Exact computation of all orders S matrix

Exact propagator in large N limit

Exact four point correlator in large N limit

S matrix in non-anyonic channels of scattering

S matrix in (singlet) S channel

Unitarity

Pole structure

Summary

S matrix in (singlet) S channel

- We cannot extract the S channel S matrix directly because of kinematic restriction $q_{\pm} = 0$.
- Usual rules of crossing symmetry in quantum field theory predict particle - anti particle scattering from particle particle scattering or vice-versa
- Naive analytic continuation gives a non-unitary S matrix in the S channel as observed in earlier work.
- Any analytic continuation cannot produce the non-analytic delta function piece required for unitarization.
- Remedy: Modify crossing symmetry rules as conjectured in [Jain, Mandlik, Minwalla, Takimi, Wadia, Yokoyama]

Conjectured S matrix in S channel $\mathcal{N} = 1$ theory

- Conjectured S matrix for the $\mathcal{N} = 1$ theory in center of mass frame

$$\mathcal{S}_B^S(s, \theta) = 8\pi\sqrt{s}\cos(\pi\lambda)\delta(\theta) + i\frac{\sin(\pi\lambda)}{\pi\lambda} \left(4\pi i\lambda\sqrt{s} \cot(\theta/2) + J_B(\sqrt{s}, \lambda) \right) ,$$

$$\mathcal{S}_F^S(s, \theta) = 8\pi\sqrt{s}\cos(\pi\lambda)\delta(\theta) + i\frac{\sin(\pi\lambda)}{\pi\lambda} \left(4\pi i\lambda\sqrt{s} \cot(\theta/2) + J_F(\sqrt{s}, \lambda) \right) .$$

$$J_B(\sqrt{s}, \lambda) = -4\pi i\lambda\sqrt{s} \frac{N_1 N_2 + M_1}{D_1 D_2} ,$$

$$J_F(\sqrt{s}, \lambda) = -4\pi i\lambda\sqrt{s} \frac{N_1 N_2 + M_2}{D_1 D_2}$$

Conjectured S matrix in S channel $\mathcal{N} = 1$ theory

$$N_1 = \left((w-1)(2m + \sqrt{s}) + (w-1)(2m - \sqrt{s})e^{i\pi\lambda} \left(\frac{\sqrt{s} + 2|m|}{\sqrt{s} - 2|m|} \right)^\lambda \right),$$

$$N_2 = \left((-i\sqrt{s}(w+3) + 2im(w-1)) + (-i\sqrt{s}(w+3) - 2im(w-1))e^{i\pi\lambda} \left(\frac{\sqrt{s} + 2|m|}{\sqrt{s} - 2|m|} \right)^\lambda \right),$$

$$M_1 = 8mi\sqrt{s}((w+3)(w-1) - 4w)e^{i\pi\lambda} \left(\frac{\sqrt{s} + 2|m|}{\sqrt{s} - 2|m|} \right)^\lambda,$$

$$M_2 = 8mi\sqrt{s}(1+w)^2 e^{i\pi\lambda} \left(\frac{\sqrt{s} + 2|m|}{\sqrt{s} - 2|m|} \right)^\lambda,$$

$$D_1 = \left(i(w-1)(2m + \sqrt{s}) - (2im(w-1) + i\sqrt{s}(w+3))e^{i\pi\lambda} \left(\frac{\sqrt{s} + 2|m|}{\sqrt{s} - 2|m|} \right)^\lambda \right),$$

$$D_2 = \left((\sqrt{s}(w+3) - 2im(w-1)) + (w-1)(-i\sqrt{s} + 2im)e^{i\pi\lambda} \left(\frac{\sqrt{s} + 2|m|}{\sqrt{s} - 2|m|} \right)^\lambda \right)$$

Straightforward non-relativistic limit of the $\mathcal{N} = 1$ S matrix

- Non-rel limit: $\sqrt{s} \rightarrow 2m$ with all other parameters held fixed.

$$\mathcal{T}_B^S(s, \theta) = -8\pi i \sqrt{s} (\cos(\pi\lambda) - 1) \delta(\theta) + 4\sqrt{s} \sin(\pi\lambda) (i \cot(\theta/2) - 1) ,$$

$$\mathcal{T}_F^S(s, \theta) = -8\pi i \sqrt{s} (\cos(\pi\lambda) - 1) \delta(\theta) + 4\sqrt{s} \sin(\pi\lambda) (i \cot(\theta/2) + 1) .$$

- conjectured S channel S matrix has simple non-relativistic limit leading to known Aharonov-Bohm result.
- Surprisingly this result is also same as the $\mathcal{N} = 2$ S channel S matrix.
- Presumably supersymmetry enhancement in non-relativistic limit.

Summary

Unitarity equations for T , U_d and U_e channels

- Writing $S_B = I + iT_B$, $S_F = I + iT_f$
- The S matrices in the T , U_d and U_e channels are all $O(1/N)$
 - unitarity equation is linear

$$\mathcal{T}_B(\mathbf{p}_1, \mathbf{p}_2, \mathbf{p}_3, \mathbf{p}_4) = \mathcal{T}_B^*(\mathbf{p}_3, \mathbf{p}_4, \mathbf{p}_1, \mathbf{p}_2) ,$$

$$\mathcal{T}_F(\mathbf{p}_1, \mathbf{p}_2, \mathbf{p}_3, \mathbf{p}_4) = \mathcal{T}_F^*(\mathbf{p}_3, \mathbf{p}_4, \mathbf{p}_1, \mathbf{p}_2)$$

- Linearity: No branch cuts in the physical domain of scattering in these channels.
- Explicitly checked that unitarity conditions are obeyed using

$$J_B(q, \lambda) = J_B^*(-q, \lambda) , \quad J_F(q, \lambda) = J_F^*(-q, \lambda)$$

- The S matrix in the S channel is $O(1)$ - the unitarity conditions are non-linear

Unitarity equations in the S channel

- Consider the general structure ($T(\theta) = i \cot(\theta/2)$.)

$$\mathcal{T}_B^S = H_B T(\theta) + W_B - iW_2 \delta(\theta) , \quad \mathcal{T}_F^S = H_F T(\theta) + W_F - iW_2 \delta(\theta) ,$$

- first unitarity equation

$$H_B - H_B^* = \frac{1}{8\pi\sqrt{s}}(W_2 H_B^* - H_B W_2^*) ,$$

$$W_2 + W_2^* = -\frac{1}{8\pi\sqrt{s}}(W_2 W_2^* + 4\pi^2 H_B H_B^*) ,$$

$$W_B - W_B^* = \frac{1}{8\pi\sqrt{s}}(W_2 W_B^* - W_2^* W_B) - \frac{i}{4\sqrt{s}}(H_B H_B^* - W_B W_B^*) - \frac{i\gamma}{4\sqrt{s}}(W_B - W_F)(W_B^* - W_F^*)$$

- Second unitarity equation

$$H_F - H_F^* = \frac{1}{8\pi\sqrt{s}}(W_2 H_F^* - H_F W_2^*) ,$$

$$W_2 + W_2^* = -\frac{1}{8\pi\sqrt{s}}(W_2 W_2^* + 4\pi^2 H_F H_F^*) ,$$

$$W_F - W_F^* = \frac{1}{8\pi\sqrt{s}}(W_2 W_F^* - W_2^* W_F) - \frac{i}{4\sqrt{s}}(H_F H_F^* - W_F W_F^*) - \frac{i\gamma}{4\sqrt{s}}(W_B - W_F)(W_B^* - W_F^*)$$

Unitarity equation in the S channel

- Unitarity equations are verified using

$$H_B = H_F = 4\sqrt{s} \sin(\pi\lambda), \quad W_2 = 8\pi\sqrt{s}(\cos(\pi\lambda)-1), \quad T(\theta) = i \cot(\theta/2)$$

$$W_B = J_B(\sqrt{s}, \lambda) \frac{\sin(\pi\lambda)}{\pi\lambda},$$
$$W_F = J_F(\sqrt{s}, \lambda) \frac{\sin(\pi\lambda)}{\pi\lambda}.$$

- Algebraic-miracle:** Non-linear unitarity equations obeyed by very complicated functions.
- unitarity is an extremely sensitive test ¹.
- Important to note that the crossing symmetry rules have to be modified exactly as conjectured in [Jain, Mandlik, Minwalla, Takimi, Wadia, Yokoyama], else the unitarity test fails.

¹Tagline: one sign is doom

Unitarity in the S channel - $\mathcal{N} = 2$ case

- The $\mathcal{N} = 2$ T matrix is tree level exact in T, U channels.
- Naive crossing symmetry would imply the same for S channel, unitarity equation $i(T^\dagger - T) = TT^\dagger$ would never be obeyed (LHS would be zero).
- Tree-level S matrices do not have singularities needed to satisfy Cutkosky rules obtained when glued.

- modified crossing rules resolve this puzzle:

$$\mathcal{T}_B^{S;\mathcal{N}=2}(s, \theta) = -8\pi i\sqrt{s}(\cos(\pi\lambda) - 1)\delta(\theta) + \sin(\pi\lambda)(4i\sqrt{s}\cot(\theta/2) - 8m),$$

$$\mathcal{T}_F^{S;\mathcal{N}=2}(s, \theta) = -8\pi i\sqrt{s}(\cos(\pi\lambda) - 1)\delta(\theta) + \sin(\pi\lambda)(4i\sqrt{s}\cot(\theta/2) + 8m).$$

- S matrix continues to be simple, but not tree level exact in the singlet channel.
- Non-analytic piece makes $\mathcal{T}_B, \mathcal{T}_F$ not Hermitian - term proportional to identity is imaginary.

Summary

Analytic structure of S channel S matrix

- The S matrix in the singlet channel has an **interesting analytic structure**.
- As a function of s (at fixed t), there is the expected two particle branch cut starting at $s = 4m^2$.
- For smaller but **positive values of s** there exist **poles in the S matrix** for a range of coupling parameters.
- These **poles represent bound states** that exist at large but finite N .
- At some **critical value** of the scalar coupling $w = w_c(\lambda)$ the **pole becomes massless!**

Poles of the S matrix

- Both bosonic and fermionic S matrix have a **pole at threshold** for $w \leq -1$. Near $w = -1 - \delta w$, $y = 1 - \delta y$ the S matrix has the pole structure ($y = \sqrt{s}/2m$)

$$\mathcal{T}_B \sim \frac{\left(\frac{\delta y}{2}\right)^{|\lambda|}}{\delta w - 2\left(\frac{\delta y}{2}\right)^{|\lambda|}}, \quad \mathcal{T}_F \sim \frac{\left(\frac{\delta y}{2}\right)^{1+|\lambda|}}{\delta w - 2\left(\frac{\delta y}{2}\right)^{|\lambda|}}$$

- As w is decreased further and as it hits a **critical value** $w = w_c$

$$w = w_c(\lambda) = 1 - \frac{2}{|\lambda|}$$

- the **pole becomes massless!**. Near $w = w_c - \delta w$ and $y = \delta y$ the poles **approach zero mass quadratically**

$$\mathcal{T}_B \sim \mathcal{T}_F - \frac{64|m|\sin(\pi\lambda)(-1+|\lambda|)}{|\lambda|(\delta w^2\lambda^2 - 4\delta y^2(1-|\lambda|)^2)}$$

Poles of the S matrix

- As w is further decreased and **as $w \rightarrow -\infty$ the pole approaches threshold** once again. Near $w = -\frac{1}{\delta w}, y = 1 - \delta y$ the S matrix has the pole structure

$$\mathcal{T}_B \sim \frac{\left(\frac{\delta y}{2}\right)^{2-|\lambda|}}{\delta w - \frac{1}{2} \left(\frac{\delta y}{2}\right)^{1-|\lambda|}}, \quad \mathcal{T}_F \sim \frac{\left(\frac{\delta y}{2}\right)^{1-|\lambda|}}{\delta w - \frac{1}{2} \left(\frac{\delta y}{2}\right)^{1-|\lambda|}}$$

- Under **duality the scaling behavior at $w = -1$ maps to $w = -\infty$ and vice versa.**
- scaling behavior at $w = w_c$ is self dual.**

Poles of the S matrix

- Both bosonic and fermionic S matrices have a pole at threshold ($s = 4m^2$) for $w \leq -1$. For $w \leq -1 + \epsilon$ the pole is close to threshold.
- As w is decreased further and as it hits a critical value $w = w_c$ the pole becomes massless!

$$w = w_c(\lambda) = 1 - \frac{2}{|\lambda|}$$

- As w is further decreased and as $w \rightarrow -\infty$ the pole approaches threshold once again.
- To summarize, a one parameter tuning of the superpotential interaction parameter w - sufficient to produce massless bound states in a massive theory.
- w can be scaled to w_c - possible decoupled QFT description of light states.

Exact computation of all orders S matrix

Unitarity

Pole structure

Summary

Summary

- Computations and conjectures for the all orders $2 \rightarrow 2$ S matrix in the general renormalizable $\mathcal{N} = 1$ Chern-Simons matter theory with a single fundamental matter multiplet.
- Used supersymmetric ward identity to derive conditions and constraints on off-shell correlators, on-shell S matrices and derive unitarity conditions.
- Computed exact offshell four point correlators in the large N limit in kinematic regime $q_{\pm} = 0$.
- Obtained S matrices by taking onshell limit of offshell four point correlator.
- Conjectured S matrix in the singlet channel.

Summary

- Results are consistent with duality.
- Results are consistent with unitarity if and only if we assume that the usual results of crossing symmetry are modified in precisely the manner proposed in [Jain, Mandlik, Minwalla, Takimi, Wadia, Yokoyama].
- Non-relativistic limit of the S matrix reproduces the known Aharonov-Bohm result.
- The S channel S matrix has an interesting analytic structure. In a certain range of superpotential parameters the S matrix has a bound state pole.
- A one parameter tuning of superpotential parameters can be used to set the pole mass to zero.

Future outlook

- $\mathcal{N} = 2$ S matrices are tree level exact in non-anyonic channels and depend on λ very simple way in the anyonic channel - can it reproduced from general principles and $\mathcal{N} = 2$ supersymmetry?
- Generalisation to higher supersymmetry - mass deformed $\mathcal{N} = 3, 4, 5$, and mass deformed $\mathcal{N} = 6$ ABJ theory - in progress [K.I, S.Jain, S.Minwalla, S. Yokoyama]
- decoupled gapless sector: effective field theory for the massless bound states of the S matrix.
- Four point correlator: useful in computation of 2,3,4 point functions of gauge invariant currents - explicit computation in $\mathcal{N} = 2$ theory?, possible $\mathcal{N} = 2$ generalisation of Maldacena-Zhiboedov solutions - in progress [K.I, S.Jain, P.Nayak]

Current-Current correlators in $\mathcal{N} = 2$ theory

- two point J_0 correlator

$$\langle J_0(\theta_1, q) J_0(\theta_2, -q) \rangle = \frac{N}{8\pi|q|\lambda} \exp(-\theta_1^\alpha \theta_2^\beta q_{\alpha\beta}) \left(\sin(\pi\lambda) + |q|(1 - \cos(\pi\lambda)) \delta^2(\theta_1 - \theta_2) \right)$$

- three point J_0 correlator

$$\begin{aligned} \langle J_0(\theta_1, q) J_0(\theta'_1, q') J_0(\theta''_1, -q - q') \rangle = & \left(\frac{N}{72 q_3 q'_3 (q_3 + q'_3)} \frac{\sin(\pi\lambda)}{\pi\lambda} \right) \left[-9 \cos(\pi\lambda) \right. \\ & + 9i \sin(\pi\lambda) (q_3 X_{11''}^- X_{11''}^+ + q'_3 X_{1'1''}^- X_{1'1''}^+) \\ & + 3 \cos(\pi\lambda) (q'_3 - q_3) (X_{11''}^- X_{1'1''}^+ - X_{1'1''}^- X_{11''}^+) \\ & \left. - \cos(\pi\lambda) (q_3^2 + 7q_3 q'_3 + q_3'^2) X_{11''}^- X_{11''}^+ X_{1'1''}^- X_{1'1''}^+ \right] \\ & \times e^{\frac{1}{3} X \cdot (q \cdot X_{11''} + q' \cdot X_{1'1''})} \text{ [K.I, S.Jain, P.Nayak]} \end{aligned}$$

Open questions -

- Rigorous proof of delta function and modified crossing rules, generalisation to finite N and κ .
- Modified crossing factor $\frac{\sin(\pi\lambda)}{\pi\lambda}$ is identical to the expectation value of circular wilson loop in pure Chern-Simons theory on S^3 .
- To explore: Path integral derivation of Witten's result, crossing and fusion rules in RCFT's.

Summary

Thank You!

Susy constraints on two-point correlator

- Supersymmetric ward identity for two point correlator

$$(Q_{\theta_1,p} + Q_{\theta_2,-p}) \langle \bar{\Phi}(\theta_1, p) \Phi(\theta_2, -p) \rangle = 0$$

- Exact propagator solves the ward identity

$$\langle \bar{\Phi}(p, \theta_1) \Phi(-p', \theta_2) \rangle = (2\pi)^3 \delta^3(p - p') P(\theta_1, \theta_2, p)$$

$$P(\theta_1, \theta_2, p) = (C_1(p^\mu) D_{\theta_1,p}^2 + C_2(p^\mu)) \delta^2(\theta_1 - \theta_2)$$

- eg for bare propagator

$$C_1 = \frac{1}{p^2 + m_0^2}, \quad C_2 = \frac{m_0}{p^2 + m_0^2}$$

Susy constraints on four-point function

- Supersymmetric ward identity for four point function

$$(Q_{\theta_1, p+q} + Q_{\theta_2, -p} + Q_{\theta_3, -k-q} + Q_{\theta_4, k})V(\theta_1, \theta_2, \theta_3, \theta_4, p, k, q) = 0$$

$$\begin{aligned} \langle \bar{\Phi}((p+q + \frac{l}{4}), \theta_1) \Phi(-p + \frac{l}{4}, \theta_2) \Phi(-(k+q) + \frac{l}{4}, \theta_3) \bar{\Phi}(k + \frac{l}{4}, \theta_4) \rangle \\ = (2\pi)^3 \delta(l) V(\theta_1, \theta_2, \theta_3, \theta_4, p, k, q) \end{aligned}$$

Susy constraints on four-point function

- Solution of the ward identity

$$V = \exp \left(\frac{1}{4} X \cdot (p \cdot X_{12} + q \cdot X_{13} + k \cdot X_{43}) \right) F(X_{12}, X_{13}, X_{43}, p, q, k)$$

$$X = \sum_{i=1}^4 \theta_i, \quad X_{ij} = \theta_i - \theta_j,$$

- F is a shift invariant function $\theta_i \rightarrow \theta_i + \gamma$.
- V may be taken to be invariant under the Z_2 symmetry

$$p \rightarrow k + q, k \rightarrow p + q, q \rightarrow -q, \\ \theta_1 \rightarrow \theta_4, \theta_2 \rightarrow \theta_3, \theta_3 \rightarrow \theta_2, \theta_4 \rightarrow \theta_1$$

An integral equation for the four point function

- Most general form of F can be parameterized in terms of 32 bosonic functions of p, k and q .
- leads to 32 coupled integral equations - tedious.
- In the kinematic regime $q_{\pm} = 0$ the ansatz

$$V = \exp\left(\frac{1}{4}X \cdot (p \cdot X_{12} + q \cdot X_{13} + k \cdot X_{43})\right) F(X_{12}, X_{13}, X_{43}, p, q, k)$$
$$F = X_{12}^+ X_{43}^+ \left(A(p, k, q) X_{12}^- X_{43}^- X_{13}^+ X_{13}^- + B(p, k, q) X_{12}^- X_{43}^- \right. \\ \left. + C(p, k, q) X_{12}^- X_{13}^+ + D(p, k, q) X_{13}^+ X_{43}^- \right)$$

is closed under the multiplication rule induced by the RHS of the integral equation.

Need for a conjecture

- $P_i(p_1) + A^i(p_2) \rightarrow P_m(p_3) + A^n(p_4)$

- Work in light-cone gauge in the frame $q_{\pm} = 0$.
- Adjoint channel (from top) - $q_{\pm} = 0$ is a frame choice, full answer can be obtained by covariantizing.

$$p_1 = p + q, \quad p_2 = -k - q, \quad p_3 = p, \quad p_4 = -k$$

- Singlet channel (from left), exchange momentum cannot be spacelike!

$$p_1 = p + q, \quad p_2 = -p, \quad p_3 = k + q, \quad p_4 = -k$$

- Cannot compute singlet channel directly.
- Using usual crossing symmetry gives a non-unitary S matrix for singlet channel.
